

Sampling and Reconstruction

The sampling and reconstruction process

- Real world: continuous
- Digital world: discrete

Basic signal processing

- Fourier transforms
- The convolution theorem
- The sampling theorem

Aliasing and antialiasing

- Uniform supersampling
- Nonuniform supersampling

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Imagers = Signal Sampling

All imagers convert a continuous image to a discrete sampled image by integrating over the active "area" of a sensor.

$$R = \int_T \int_\Omega \int_A L(x, \omega, t) P(x) S(t) \cos \theta dA d\omega dt$$

Examples:

- Retina: photoreceptors
- CCD array

Virtual CG cameras do not integrate,
they simply sample radiance along rays ...

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Displays = Signal Reconstruction

All physical displays recreate a continuous image from a discrete sampled image by using a finite sized source of light for each pixel.

Examples:

- DACs: sample and hold
- Cathode ray tube: phosphor spot and grid

Sampling in Computer Graphics

Artifacts due to sampling - Aliasing

- Jaggies
- Moire
- Flickering small objects
- Sparkling highlights
- Temporal strobing

Preventing these artifacts - Antialiasing

Basic Signal Processing

Fourier Transforms

Spectral representation treats the function as a weighted sum of sines and cosines

Each function has two representations

- **Spatial domain - normal representation**
- **Frequency domain - spectral representation**

The *Fourier transform* converts between the spatial and frequency domain

$$\begin{array}{ccc} \boxed{\text{Spatial Domain}} & \begin{array}{c} \Rightarrow F(\omega) = \int_{-\infty}^{\infty} f(x)e^{-i\omega x} dx \\ \Leftarrow f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(\omega)e^{i\omega x} d\omega \Leftarrow \end{array} & \boxed{\text{Frequency Domain}} \end{array}$$

Convolution

Definition

$$h(x) = f \otimes g = \int f(x')g(x - x') dx'$$

Convolution Theorem: Multiplication in the frequency domain is equivalent to convolution in the space domain.

$$f \otimes g \leftrightarrow F \times G$$

Symmetric Theorem: Multiplication in the space domain is equivalent to convolution in the frequency domain.

$$f \times g \leftrightarrow F \otimes G$$

The Sampling Theorem

Sampling: Spatial Domain

$$\text{III}(x) = \sum_{n=-\infty}^{n=\infty} \delta(x - nT)$$

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Sampling: Frequency Domain

$$f_s = \frac{1}{T} \quad \omega_s = 2\pi f_s = \frac{2\pi}{T}$$

$$\text{III}(\omega) = \sum_{n=-\infty}^{n=\infty} \delta(\omega - n\omega_s)$$

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Reconstruction: Frequency Domain

$$\Pi(x) = \begin{cases} 1 & |x| \leq \frac{1}{2} \\ 0 & |x| > \frac{1}{2} \end{cases}$$

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Reconstruction: Spatial Domain

$$\text{sinc } x = \frac{\sin \pi x}{\pi x}$$

Sampling Theorem

This result is known as the Sampling Theorem and is due to Claude Shannon who first discovered it in 1949

A signal can be reconstructed from its samples without loss of information, if the original signal has no frequencies above 1/2 the Sampling frequency

For a given bandlimited function, the rate at which it must be sampled is called the *Nyquist Frequency*

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Aliasing

Undersampling: Aliasing

Sampling a "Zone Plate"

Zone plate: $\sin x^2 + y^2$

**Sampled at 128x128
Reconstructed to 512x512
Using a 30-wide
Kaiser windowed sinc**

**Left rings: part of signal
Right rings: prealiasing**

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Ideal Reconstruction

Ideally, use a perfect low-pass filter - the sinc function - to bandlimit the sampled signal and thus remove all copies of the spectra introduced by sampling

Unfortunately,

- **The sinc has infinite extent and we must use simpler filters with finite extents. Physical processes in particular do not reconstruct with sincs**
- **The sinc may introduce ringing which are perceptually objectionable**

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Sampling a "Zone Plate"

Zone plate: $\sin x^2 + y^2$

**Sampled at 128x128
Reconstructed to 512x512
Using optimal cubic**

**Left rings: part of signal
Right rings: prealiasing
Middle rings: postaliasing**

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Mitchell Cubic Filter

$$h(x) = \frac{1}{6} \begin{cases} (12 - 9B - 6C)x^3 + (-18 + 12B + 6C)x^2 + (6 - 2B) & |x| < 1 \\ (-B - 6C)x^3 + (6B + 30C)x^2 + (-12B - 48C)x + (8B + 24C) & 1 < |x| < 2 \\ 0 & \text{otherwise} \end{cases}$$

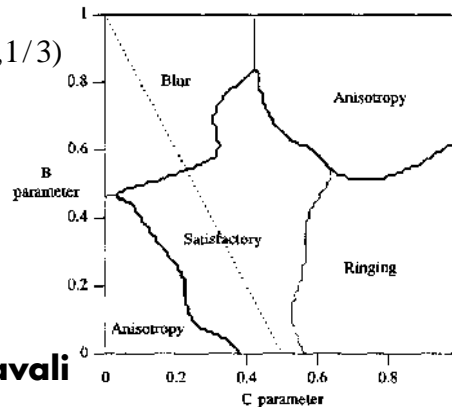

Properties:

$$\sum_{n=-\infty}^{\infty} h(x) = 1$$

B-spline: (1, 0)

Catmull-Rom: (0, 1/2)

Good: (1/3, 1/3)

From Mitchell and Netravali

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Antialiasing

Antialiasing

Antialiasing = Preventing aliasing

- 1. Analytically prefilter the signal**
 - Solvable for points, lines and polygons
 - Not solvable in general
e.g. procedurally defined images
- 2. Uniform supersampling and resample**
- 3. Nonuniform or stochastic sampling**

Antialiasing by Prefiltering

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Uniform Supersampling

Increasing the sampling rate moves each copy of the spectra further apart, potentially reducing the overlap and thus aliasing

Resulting samples must be resampled (filtered) to image sampling rate

Samples

$$Pixel = \sum_s w_s \cdot Sample_s$$

Pixel

Fourier transform

Yellot theory

- Aliases replaced by noise
- Visual system less sensitive to high freq noise

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Non-uniform Sampling

Intuition

Uniform sampling

- The spectrum of uniformly spaced samples is also a set of uniformly spaced spikes
- Multiplying the signal by the sampling pattern corresponds to placing a copy of the spectrum at each spike (in freq. space)
- Aliases are coherent, and very noticeable

Non-uniform sampling

- Samples at non-uniform locations have a different spectrum; a single spike plus noise
- Sampling a signal in this way converts aliases into broadband noise
- Noise is incoherent, and much less objectionable

CS348B Lecture 8

Pat Hanrahan, Spring 2002

Jittered Sampling

Add uniform random jitter to each sample
